

```
stay(human).sec:~$ cat protect.md
```

5-MINUTE FIX

One setting stops most
account takeovers cold.

Have you turned it on?

Two-factor authentication.
Here's what it actually protects.

here's why -> 

 stay(human).sec

1/4

```
stay(human).sec:~$ cat protect.md
```

— □ ✕

WHY IT MATTERS

Your password will leak eventually.

Breaches happen to companies, not just people — and once a password's out there, it gets tried against every other site you might have reused it on. 2FA is what stops that stolen password from being enough.

here's the fix -> 

() stay(human).sec

2/4

```
stay(human).sec:~$ cat protect.md
```

— □ ✕

THE FIX

Turn it on, in order:

1. EMAIL

It can reset almost everything else — start here.

2. BANKING

Anything holding payment info comes next.

3. EVERYTHING ELSE

Authenticator app beats SMS where available.

one more thing -> 

```
stay(human).sec
```

3/4

```
stay(human).sec:~$ cat protect.md
```
