CYBER NEWS

Chick-fil-A's rewards app

just got hit.

Not by a hack.

By a stolen password.

Here's what actually happened.

here's the story -> 

 stay(human).sec

1/4

WHY IT MATTERS

This wasn't Chick-fil-A's fault.

Attackers didn't break into their servers. They took passwords stolen from totally different sites and tried them here — automatically, for three days straight. Whenever someone had reused a password, it worked.

here's the fix ->

THE FIX

Check your account. Then fix the real problem.

CHECK

Open the app — does your balance and payment method look right?

CHANGE

Reused that password anywhere else? Change it now.

TURN ON

2FA, if it's offered — a stolen password alone stops being enough.

one more thing ->

```
stay(human).sec:~$ cat alert.md
```

FILE_009.md

Not a Chick-fil-A problem. A reused-password problem.

The fix is five minutes. **Do it today.**

Like. Comment. Follow.
(yes, all three – we're needy)

More real stories, every
time it's our turn.
